

Our **Carrier Status Reports** tell you about variants that may not affect your health, but could affect the health of your family.

The following concepts may help you understand your reports.

Start

A carrier is a person who has one gene variant for a recessive health condition.

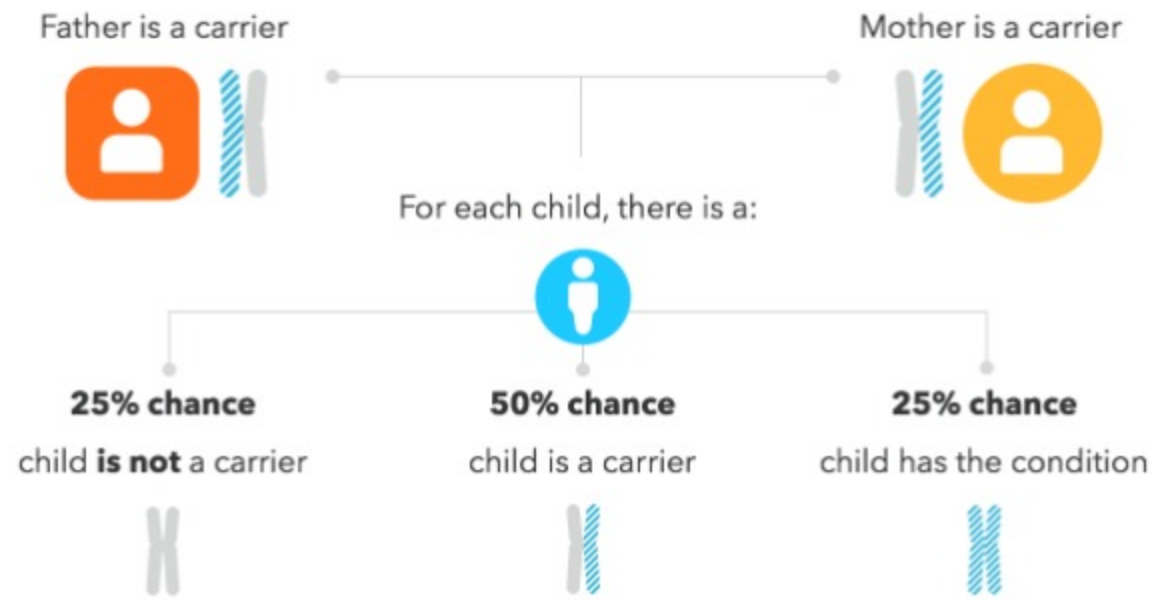

Carriers typically do not have the genetic condition. But, they could pass the gene variant down to their children.

Back

Next

If both parents are carriers, their child may inherit two variants and have the condition.

Below are three examples of the types of results our reports provide.

0 variants detected		Likely not a carrier This person could still have a variant not covered by this test.
1 variant detected		Carrier This person could pass the variant on to his or her child.
Not determined		Not determined This test may not be able to provide a result in rare instances.

Genetic conditions affect certain ethnicities more than others.

Our reports can provide more detailed information for ethnicities that have been well studied.

Knowing your carrier status is important when starting a family.

Our tests **do not diagnose** any health conditions.

Our reports can help you understand your chances of carrying a variant that could be passed down. This can be helpful for you or your relatives when having children.
