You have an increased risk of developing male breast cancer and prostate cancer based on your result.

We recommend you consult with a healthcare professional about what these findings mean for you and your family.

About BRCA1/BRCA2Related Cancers

- Male breast cancer
- Prostate cancer
- Pancreatic cancer
- Occasional other cancers

Inheritance

- Male
- Female

It is important to discuss this result with a healthcare professional.
Frequently Asked Questions

Specific genetic variants in the BRCA1 and BRCA2 genes are associated with an increased risk of breast and ovarian cancers. People with these genetic variants are at a higher risk of developing breast or ovarian cancer compared to the general population. However, these genetic variants only increase the risk of developing cancer by about 5-10% for each variant. Therefore, it is not generally recommended for individuals to be tested for the BRCA1 and BRCA2 genes. People with a family history of breast or ovarian cancer may consider genetic testing to determine their own risk. Genetic testing is not recommended for the general population as it does not provide any benefits to individuals who do not have a family history of breast or ovarian cancer.

BRCA1/BRCA2 (Definitive Teaser)

What is the BRCA1/BRCA2 test?

This is a genetic test that can be used to determine if you have specific genetic variants in the BRCA1 and BRCA2 genes. People with these genetic variants are at a higher risk of developing breast or ovarian cancer compared to the general population. However, these genetic variants only increase the risk of developing cancer by about 5-10% for each variant. Therefore, it is not generally recommended for individuals to be tested for the BRCA1 and BRCA2 genes. People with a family history of breast or ovarian cancer may consider genetic testing to determine their own risk.

What is the BRCA1/BRCA2 test used for?

The BRCA1/BRCA2 test is used to determine if you have specific genetic variants in the BRCA1 and BRCA2 genes. People with these genetic variants are at a higher risk of developing breast or ovarian cancer compared to the general population. However, these genetic variants only increase the risk of developing cancer by about 5-10% for each variant. Therefore, it is not generally recommended for individuals to be tested for the BRCA1 and BRCA2 genes. People with a family history of breast or ovarian cancer may consider genetic testing to determine their own risk.

What are the BRCA1 and BRCA2 genes?

The BRCA1 and BRCA2 genes are genes that play a role in regulating cell growth and division. When these genes are mutated or altered, it can increase the risk of developing breast or ovarian cancer. People with a family history of breast or ovarian cancer may be at an increased risk of developing cancer if they have specific genetic variants in the BRCA1 or BRCA2 genes.

What are the BRCA1/BRCA2 genes?

The BRCA1 and BRCA2 genes are genes that play a role in regulating cell growth and division. When these genes are mutated or altered, it can increase the risk of developing breast or ovarian cancer. People with a family history of breast or ovarian cancer may be at an increased risk of developing cancer if they have specific genetic variants in the BRCA1 or BRCA2 genes.

What is BRCA1/BRCA2 testing for?

BRCA1/BRCA2 testing is used to determine if you have specific genetic variants in the BRCA1 and BRCA2 genes. People with these genetic variants are at a higher risk of developing breast or ovarian cancer compared to the general population. However, these genetic variants only increase the risk of developing cancer by about 5-10% for each variant. Therefore, it is not generally recommended for individuals to be tested for the BRCA1 and BRCA2 genes. People with a family history of breast or ovarian cancer may consider genetic testing to determine their own risk.

What does BRCA1/BRCA2 testing involve?

BRCA1/BRCA2 testing involves collecting a blood sample or a tissue sample from a cancer biopsy. The genetic material in the sample is then analyzed to determine if you have specific genetic variants in the BRCA1 and BRCA2 genes. People with these genetic variants are at a higher risk of developing breast or ovarian cancer compared to the general population. However, these genetic variants only increase the risk of developing cancer by about 5-10% for each variant. Therefore, it is not generally recommended for individuals to be tested for the BRCA1 and BRCA2 genes. People with a family history of breast or ovarian cancer may consider genetic testing to determine their own risk.

What is a BRCA1/BRCA2 risk assessment?

BRCA1/BRCA2 risk assessment is a process that involves evaluating your family history and considering other factors to determine your risk of developing breast or ovarian cancer. People with a family history of breast or ovarian cancer may be at an increased risk of developing cancer if they have specific genetic variants in the BRCA1 or BRCA2 genes.

What is the BRCA1/BRCA2 test used for?

The BRCA1/BRCA2 test is used to determine if you have specific genetic variants in the BRCA1 and BRCA2 genes. People with these genetic variants are at a higher risk of developing breast or ovarian cancer compared to the general population. However, these genetic variants only increase the risk of developing cancer by about 5-10% for each variant. Therefore, it is not generally recommended for individuals to be tested for the BRCA1 and BRCA2 genes. People with a family history of breast or ovarian cancer may consider genetic testing to determine their own risk.

What is the BRCA1/BRCA2 test for?

The BRCA1/BRCA2 test is used to determine if you have specific genetic variants in the BRCA1 and BRCA2 genes. People with these genetic variants are at a higher risk of developing breast or ovarian cancer compared to the general population. However, these genetic variants only increase the risk of developing cancer by about 5-10% for each variant. Therefore, it is not generally recommended for individuals to be tested for the BRCA1 and BRCA2 genes. People with a family history of breast or ovarian cancer may consider genetic testing to determine their own risk.

What is BRCA1/BRCA2 testing?

BRCA1/BRCA2 testing involves collecting a blood sample or a tissue sample from a cancer biopsy. The genetic material in the sample is then analyzed to determine if you have specific genetic variants in the BRCA1 and BRCA2 genes. People with these genetic variants are at a higher risk of developing breast or ovarian cancer compared to the general population. However, these genetic variants only increase the risk of developing cancer by about 5-10% for each variant. Therefore, it is not generally recommended for individuals to be tested for the BRCA1 and BRCA2 genes. People with a family history of breast or ovarian cancer may consider genetic testing to determine their own risk.

What does BRCA1/BRCA2 testing involve?

BRCA1/BRCA2 testing involves collecting a blood sample or a tissue sample from a cancer biopsy. The genetic material in the sample is then analyzed to determine if you have specific genetic variants in the BRCA1 and BRCA2 genes. People with these genetic variants are at a higher risk of developing breast or ovarian cancer compared to the general population. However, these genetic variants only increase the risk of developing cancer by about 5-10% for each variant. Therefore, it is not generally recommended for individuals to be tested for the BRCA1 and BRCA2 genes. People with a family history of breast or ovarian cancer may consider genetic testing to determine their own risk.

What is a BRCA1/BRCA2 risk assessment?

BRCA1/BRCA2 risk assessment is a process that involves evaluating your family history and considering other factors to determine your risk of developing breast or ovarian cancer. People with a family history of breast or ovarian cancer may be at an increased risk of developing cancer if they have specific genetic variants in the BRCA1 or BRCA2 genes.

What is the BRCA1/BRCA2 test used for?

The BRCA1/BRCA2 test is used to determine if you have specific genetic variants in the BRCA1 and BRCA2 genes. People with these genetic variants are at a higher risk of developing breast or ovarian cancer compared to the general population. However, these genetic variants only increase the risk of developing cancer by about 5-10% for each variant.
