BRCA1/BRCA2 (Selected Variants)

You do not have two of the three genetic variants we tested.

How To Use This Test

You may not display or reproduce any content from this page on any site or in any manner without the express written permission of 23andMe.

Learn more about managing consent for use of genetic information

You do not have two of the three variants we tested. Therefore, you are at a lower risk for hereditary breast and/or ovarian cancer.

If you have a personal or family history of cancer, talk to a healthcare professional about other testing options.

Lifestyle, family history, and other factors can also influence the chances of developing breast cancer or prostate cancer.

About BRCA1/BRCA2-Related Cancers

BRCA1 and BRCA2 are oncogenes that are associated with breast cancer and other cancers. When BRCA1 or BRCA2 mutations are present, these genes may not function properly, increasing the risk of these cancers. The BRCA1 and BRCA2 gene variants we tested are the most common to be associated with breast cancer.

You may want to consult with your healthcare provider about testing for other BRCA1/BRCA2 variants, or other genetic testing options.
