

Glycogen Storage Disease Type Ia

GSDIa is a rare genetic disorder. It is characterized by low blood sugar, liver and kidney problems, and poor growth. A person must have two variants in the G6PC gene in order to have this condition.

Overview Scientific Details

Jamie, you **do not have the variant** we tested.

You could still have a variant not covered by this test.

How To Use This Test

This test does not diagnose any health conditions.

Please talk to a healthcare professional if this condition runs in your family, you think you might have this condition, or you have any concerns about your results.

[See Scientific Details](#)

+ Intended Uses

- To test for the R83C variant in the G6PC gene.
- To identify carrier status for GSDIa.

- Limitations

- Does **not test** for all possible variants for the condition.
- Does **not report** if someone has two copies of a tested variant.
- Does **not cover** other subtypes of glycogen storage disease.

🌐 Important Ethnicities

- This test is most relevant for people of Ashkenazi Jewish descent.

You are likely not a carrier.

This result may be less relevant for you because the variants that cause GSDIa are rarely found in people of your ethnicity.

We ruled out the tested variant for GSDIa.

This variant is most common in people of **Ashkenazi Jewish** descent.

You still have a chance of being a carrier for GSDIa.

We cannot estimate your chances because this condition is rare and not well studied in your ethnicity.

About Glycogen Storage Disease Type Ia

Also known as: von Gierke Disease

📅 When symptoms develop

Symptoms typically develop during infancy.

🚨 Typical signs and symptoms

- Low blood sugar
- Liver enlargement
- Very short height
- Kidney and liver problems
- Anemia

👥 Ethnicities most affected

This condition is most common in people of Ashkenazi Jewish descent.

💊 How it's treated

There is currently no known cure. Treatment focuses on managing diet to control blood sugar levels and prevent problems with metabolism.

Consider talking to a healthcare professional if you are concerned about your results.

If you're starting a family, a genetic counselor can help you and your partner understand if additional testing might be appropriate.

Glycogen Storage Disease Type Ia

GSDIa is a rare genetic disorder. It is characterized by low blood sugar, liver and kidney problems, and poor growth. A person must have two variants in the G6PC gene in order to have this condition.

Overview **Scientific Details**

GSDIa is caused by variants in the G6PC gene.

G6PC

The G6PC gene contains instructions for making part of a protein called glucose-6-phosphatase, also known as G6Pase. This protein helps control sugar levels in the body. Certain variants in G6PC disrupt this protein's function.

*This test cannot distinguish which copy you received from which parent. This test also cannot determine whether multiple variants, if detected, were inherited from only one parent or from both parents. This may impact how these variants are passed down.

23andMe always reports genotypes based on the 'positive' strand of the human genome reference sequence (build 37). Other sources sometimes report genotypes using the opposite strand.

Test Interpretation

This report provides an estimate of the chances of still being a carrier for people who do not have the variant(s) tested. This is known as the **post-test carrier risk**.

Post-test carrier risk is based on the average chance of being a carrier for a given ethnicity and the carrier detection rate of the test for a given ethnicity.

[View technical article on estimating post-test carrier risk.](#)

Post-Test Carrier Risk

This report provides an estimate of the post-test carrier risk for people of Ashkenazi Jewish descent only.

- For people of partial Ashkenazi Jewish descent, post-test carrier risk is less than that for those who are fully Ashkenazi Jewish. The exact post-test risk depends on how much Ashkenazi Jewish ancestry a person has.
- Post-test risk for other ethnicities cannot be provided because sufficient data is not available.

Indications for Use

The 23andMe PGS Carrier Status Test for Glycogen Storage Disease Type Ia is indicated for the detection of the R83C variant in the G6PC gene. This test is intended to be used to determine carrier status for GSDIa in adults, but cannot determine if a person has two copies of a tested variant. The test is most relevant for people of Ashkenazi Jewish descent.

Special Considerations

- There are currently no professional guidelines in the U.S. for carrier testing for this condition. However, ACOG notes that testing for glycogen storage disease type I may be considered for people of Ashkenazi Jewish descent who are considering having children.

Test Performance Summary

Carrier Detection Rate & Relevant Ethnicities

The "carrier detection rate" is an estimate of the percentage of carriers for this condition that would be identified by this test. Carrier detection rate differs by ethnicity and is provided only where sufficient data is available.

Ashkenazi Jewish	98%	[2]
------------------	-----	-------

Analytical Performance

Accuracy was determined by comparing results from this test with results from sequencing. Greater than 99% of test results were correct. While unlikely, this test may provide false positive or false negative results. For more details on the analytical performance of this test, refer to the package insert.

Warnings and Limitations

- This test does not cover all variants that could cause this condition.*
- This test does not diagnose any health conditions.
- Positive results in individuals whose ethnicities are not commonly associated with this condition may be incorrect. Individuals in this situation should consider genetic counseling and follow-up testing.
- Share results with your healthcare professional for any medical purposes.
- If you are concerned about your results, consult with a healthcare professional.

See the [Package Insert](#) for more details on use and performance of this test.

* Variants not included in this test may be very rare, may not be available on our genotyping platform, or may not pass our testing standards.

Change Log

Your report may occasionally be updated based on new information. This Change Log describes updates and revisions to this report.

Date	Change
Nov. 5, 2020	The carrier frequency was updated for customers who self-report having Ashkenazi Jewish ancestry. The chances of still being a carrier were also updated for customers with no variants detected who self-report having Ashkenazi Jewish ancestry.
Oct. 21, 2015	Glycogen Storage Disease Type Ia report created.
