

Hate the Sound of Chewing?

POWERED BY 23ANDME RESEARCH

Jamie, based on your genetics, you have **slightly lower than average** odds of hating the sound of others chewing.

What is misophonia?

Almost everyone hates noises like nails on a chalkboard, but for people with a condition called misophonia, everyday noises like the sound of chewing can cause a similar reaction, along with rage or panic. Some scientists speculate that misophonia could result from increased connections between the brain systems involved in hearing (the auditory cortex) and the "fight or flight" response (the limbic system and autonomic nervous system).

Your genotype at one tested marker

23andMe researchers identified one genetic marker associated with feeling rage at the sound of other people chewing. This genetic marker is located near the TENM2 gene which is involved in brain development. Your genetic variants at this marker are associated with **slightly lower odds** of having this trait.

MARKER TESTED	YOUR GENOTYPE
rs2937573	AA
Result: Lower odds of hating chewing sounds	

How we got your result

Keep in mind that these results from 23andMe research are preliminary and are meant for informational purposes only.
