DPYD Drug Metabolism

The DPYD gene provides instructions for making the DPD enzyme, which helps process (or "metabolize") certain medications. Specific variants in the DPYD gene can affect how well this enzyme works. Do not use this report to start, stop, or change any course of treatment. Medications should always be taken as directed.

Overview | Scientific Details | Frequently Asked Questions

Jamie, you do not have the variants we tested. This result is associated with normal function of the DPD enzyme.

People with your genetic result are predicted to be **DPYD normal metabolizers**.
Keep in mind you may still have other DNA variants not tested that could alter the function of your DPD enzyme and affect how you process certain medications.

VARIANT(S) DETECTED	OVERALL FUNCTIONAL EFFECT
No variants detected	Normal enzyme function

Predicted DPYD normal metabolizer

People who are predicted to be DPYD normal metabolizers likely have normal function of their DPD enzyme. The DPD enzyme helps metabolize certain medications.

Keep in mind that DPYD normal metabolizers may still have DNA variants in the DPYD gene or in other genes that could influence how the body processes certain medications.

DPYD Metabolism

Test Limitations

Does **not** provide information on associations between specific DNA variants and any specific medications.

Does **not** account for lifestyle or other health factors that may affect an individual's ability to process medications.

Does **not** include all possible DNA variants in the DPYD gene or in other genes that may affect how your body processes medications.

Results from this test should not be used to make medical decisions. Results should be confirmed by an independent genetic test prescribed by your own healthcare provider before taking any medical action.

Share a summary of your Pharmacogenetics reports with a healthcare professional.

Please talk to a healthcare professional if you are interested in learning more about how DNA variants may impact processing of some medications, or if you have concerns about your results. Your healthcare provider could consider both genetic and non-genetic factors when choosing an appropriate course of treatment.

Do not use this report to start, stop, or change any course of treatment. Medications should always be taken as directed.

See examples of medications processed in part by the DPD enzyme below.

Print summary

How To Use This Test

This test does not diagnose any health conditions, determine drug response, provide medical advice, or determine whether a medication is indicated for you.

Do not use this result to start, stop, or change any course of treatment. Medications should always be taken as directed. Making changes can lead to harmful side effects or reduce intended benefits of the medication.

Review the Pharmacogenetics tutorial

See Scientific Details for complete Indications for Use statement and full list of Warnings and Limitations

See Frequently Asked Questions

Intended Uses

- Tests for two DNA variants in the DPYD gene: *2A (c.1905+1G>A) and D949V (c.2846A>T). These variants are associated with altered DPD enzyme function.
- Provides information about how these specific DNA variants may affect the function of the DPD enzyme.
- Informs individuals with certain variant combinations how these variants may be associated with a condition called dihydropyrimidine dehydrogenase (DPD) deficiency.

Limitations

- Does **not** test for all possible DNA variants in the DPYD gene that may affect DPD enzyme function. Having a variant not included in this test may change a person's predicted DPYD metabolizer profile.
- Does **not** test for DNA variants in other genes that may affect other proteins involved in the processing of medications.
- Does **not** provide information on associations between specific DNA variants and any specific medications.
- Does **not** account for lifestyle or other health factors that may affect an individual's ability to process medications.
- Results from this test should not be used to make medical decisions. Results should be confirmed by an independent genetic test prescribed by your own healthcare provider before taking any medical action.

Ethnicity Considerations

- The DNA variants included in this test are found in many ethnicities. See Scientific Details for more information.

Both genetic and non-genetic factors influence how your body processes medications.

Healthcare professionals could consider these factors and more when choosing an appropriate course of treatment.

- Drug-drug interactions
- Other DNA variants
- Other health conditions
- Following medication instructions
- Body weight
- Age

Examples of medications metabolized in part by the DPD enzyme

Oncology	capecitabine
	fluorouracil (5-FU)

Precautions

- The medications listed here are processed in part by the DPD enzyme. However, it is not known if the DNA variants included in this report affect the processing of these medications similarly in all individuals. This is because the processing of medications is influenced by many genetic and non-genetic factors, including the activity of other enzymes.
- **Do not use this result to start, stop, or change any course of treatment.** These medications should always be taken as directed. Making changes on your own can lead to side effects or reduce intended benefits of the medication.
- Results from this test should not be used to make medical decisions. Results should be confirmed by an independent genetic test prescribed by your own healthcare provider before taking any medical action.

Consider sharing this result with a healthcare professional.

FAQs

DPYD Drug Metabolism

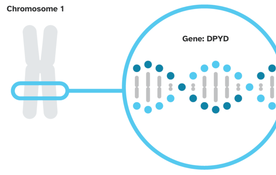
The DPYD gene provides instructions for making the DPD enzyme, which helps process (or "metabolize") certain medications. Specific variants in the DPYD gene can affect how well this enzyme works. Do not use this report to start, stop, or change any course of treatment. Medications should always be taken as directed.

Overview Scientific Details Frequently Asked Questions

Specific variants in the DPYD gene can alter the body's ability to metabolize certain medications.

DPYD

The DPYD gene contains instructions for making an enzyme called dihydropyrimidine dehydrogenase (DPD). This enzyme plays an important role in breaking down molecules called uracil and thymine. Specific variants can lead to decreased or no DPD enzyme activity, which can reduce the body's ability to metabolize certain medications that have structures similar to uracil or thymine. Keep in mind that other factors besides your genetics can also affect how your body processes medications.



You do not have the genetic variants we tested.

People with this result are predicted to be **DPYD normal metabolizers**.

Variants Detected | View All Tested Markers

Marker Tested	Your Genotype*			Additional Information
***2A** **Gene:** DPYD **Marker:** rs3918290	**C** Typical copy from one of your parents		**C** Typical copy from your other parent	Biological explanation Typical vs. variant DNA sequence(s) Percent of 23andMe customers with variant References [2]
D949V **Gene:** DPYD **Marker:** rs67376798	**T** Typical copy from one of your parents		**T** Typical copy from your other parent	Biological explanation Typical vs. variant DNA sequence(s) Percent of 23andMe customers with variant References [2]

* The percent of 23andMe customers with a variant may not be representative of the general population.

This test cannot distinguish which copy you received from which parent. This test also cannot determine whether multiple variants, if detected, were inherited from only one parent or from both parents. This may impact how these variants are passed down.

23andMe always reports genotypes based on the 'positive' strand of the human genome reference sequence (build 37). Other sources sometimes report genotypes using the opposite strand.

Test Interpretation

DNA variants in the DPYD gene can affect the function of the DPD enzyme. This altered enzyme function can influence the body's ability to metabolize certain medications. However, the metabolism of most medications isn't affected by variants in the DPYD gene. Since many other genetic as well as non-genetic factors influence how the body processes medications, having a variant detected may have no noticeable effects on how medications are processed.

The predicted metabolizer profiles listed in the table are based on the standardized terms proposed by Caudle et al. (2017). In some cases when a tested variant could not be determined, metabolizer profile may not be assigned.

Do not use this information to start, stop, or change any course of treatment. Medications should always be taken as directed. Making changes on your own can lead to side effects or possible serious events such as a heart attack, or can reduce intended benefits of the medication.

Results from this test should not be used to make medical decisions. Results should be confirmed by an independent genetic test prescribed by your own healthcare provider before taking any medical action.

References [1]

DPYD*2A is a no-function variant and DPYD D949V is a decreased-function variant. The *1 (normal function) genotype is assigned based on the absence of the two variants included in this test. Predicted normal metabolizers may still have a variant that is not included in this test, which could affect their DPD enzyme function or the function of other proteins important for drug processing.

Predicted DPYD metabolizer profile	Genotype information
DPYD normal metabolizer	No variants detected. This is designated as the *1/*1 genotype.
DPYD intermediate metabolizer	One decreased-function variant (*1/D949V) or one no-function variant (*1/*2A), or two copies of a decreased-function variant (D949V/D949V)
DPYD poor metabolizer	Two no-function variants (*2A/*2A), or one no-function variant plus one decreased-function variant (*2A/D949V)

Test Details

Indications for Use

The 23andMe Personal Genome Service (PGS) is a qualitative genotyping assessment system applied to genomic DNA isolated from human saliva to simultaneously detect, report, and interpret genetic variants in a broad multigene test. The assessment system is intended to enable users to access information about their genetics that could aid discussions with a healthcare professional.

The 23andMe Personal Genome Service Pharmacogenetics Report for DPYD is indicated for reporting of the *2A and D949V variants in the DPYD gene. This report is for over-the-counter use by adults over the age of 18, and provides genetic information to inform discussions with a healthcare professional about processing of therapeutics. This report describes if a person has DPYD variants associated with processing of some therapeutics, but does not describe if a person will or will not respond to a particular therapeutic, and does not describe the association between detected variants and any specific therapeutic. This test is not a substitute for visits to a healthcare professional. The information provided by this report should not be used to start, stop, or change any course of treatment.

Special Considerations

- There are currently no published guidelines recommending DPYD genetic testing prior to prescribing a medication. However, several clinical organizations support continued efforts to incorporate pharmacogenetic information into clinical decision making.
- Results from this test should not be used to make medical decisions. Results should be confirmed by an independent genetic test prescribed by your own healthcare provider before taking any medical action.

Test Performance Summary

Clinical Performance [2]

The *2A and D949V variants included in this report represent two of the best studied variants that can lead to reduced or no DPD enzyme activity. However, there are other DPYD variants with established functional impact and clinical relevance that are not included in this test, including *13 (c.1679T>G) and c.1129-5923C>G. In addition, there are other rare or less well-studied variants that are not included in this test.

Analytical Performance

Accuracy was determined by comparing results from this test with results from sequencing. Greater than 99% of test results were correct. While unlikely, this test may provide false positive or false negative results. For more details on the analytical performance of this test, refer to the package insert.

Warnings and Limitations

- This test does not describe any specific associations between detected variants and any specific therapeutics.
- This test does not include all variants in the DPYD gene that could influence drug processing.*
- This test does not include variants in other genes that could influence drug processing.
- This test does not diagnose any health conditions, determine drug response, provide medical advice, or determine whether a medication is indicated for you.
- Results from this test should not be used to make medical decisions. Results should be confirmed by an independent genetic test prescribed by your own healthcare provider before taking any medical action.

See the **Package Insert** for more details on use and performance of this test.

* Variants not included in this test may be rare, may not be available on our genotyping platform, or may not pass our testing standards.
